

Elements of Mechanism (Classic Reprint)

Excerpt from Elements of Mechanism
The main subject-matter of this work was written during 1885 by Peter Schwamb and has been used since then, in the form of printed notes, at the Massachusetts Institute of Technology, as a basis for instruction in mechanism, being followed by a study of the mechanism of machine tools and of cotton machinery. The notes were written because a suitable text-book could not be found which would enable the required instruction to be given in the time available. They have accomplished the desired result, and numerous inquiries have been received for copies from various institutions and individuals desiring to use them as textbooks. This outside demand, coupled with a desire to revise the notes, making such changes and additions as experience has proved advisable, is the reason for publishing at this time. Very little claim is made as to originality of the subject-matter which has been so fully covered by previous writers. Such available matter has been used as appeared best to accomplish the object desired. Claim for consideration rests largely on the manner of presenting the subject, which we have endeavored to make systematic, clear, and practical. Among the works consulted and to which we are indebted for suggestions and illustrations are the following: Kinematics of Machinery and Der Konstrukteur, by F. Reuleaux, the former for the discussion of linkages, and the latter for various illustrations of mechanisms; Principles of Mechanism, by S. W. Robinson, for the discussion of non-circular wheels; Kinematics, by C. W. MacCord, for the discussion of annular wheels and screw-gearing; Machinery and Millwork, by Rankine; Elements of Mechanism, by T. M. Goodeve; and Elements of Machine Design, by W. C. Unwin.
