Excerpt from Petroleum, Vol. 2: A Treatise on the Geographical Distribution and Geological Occurrence of Petroleum and Natural Gas, the Physical and Chemical Properties, Production and Refining of Petroleum and Ozokerite, the Characters and Uses, Testing, Transport, and Storage of Petroleum. In most petroleum-producing countries, however, and particularly where the product is abundant, the crude oil is fractionally distilled, so as to separate it into naphtha, or petroleum-spirit of various grades, burning oils, gas oil, lubricating oils, and (if the crude oil yields that product) paraffin. The distillates obtained are usually purified by treatment, successively, with sulphuric acid, and solution of caustic soda, followed by washing with water. Crude petroleum was experimentally distilled in the United States in 1833 by Professor Silliman, and the refining of petroleum in that country may be said to date from about the year 1855, when Samuel M. Kier, who introduced American Oil as a patent medicine, fitted up a small refinery with a five-barrel still, for the treatment of the oil obtained from his father's salt-wells. At this period the supply of the raw material was insufficient to admit of any important development of the industry, and before the drilling of artesian wells for petroleum was initiated by Drake, the coal- or shale-oil industry had assumed considerable proportions in the United States.
