

Timber Design - 2 Storey Timber Deck (Engineering Physics 10a)

Are you a student at a university or college? Are you paying a tutor to help you maintain your grades? Are you sitting in classes where the professor does not solve enough problems? Do you have a text book that only briefly illustrates a problem? Are you interested in becoming more proficient with your topics and understanding different ways in which a problem can be solved? If you answered YES to any of the above questions, then this Engineering Physics Series will help you. The author has taught mathematics, engineering physics, strength of materials, structural design and analysis in a university and college setting for more than 25 years. He has based this series on how students learn and the questions that were asked in classes. You will get a STEP by STEP approach with MULTIPLE SOLUTION approach. You will become proficient in solving these types of problems. This series is written so that the student can learn without the use of a tutor. Topics covered in each eBook will be comprehensive. A small price to pay to have a confident edge in solving these types of problems!! This eBook focuses on Timber Design Part 1. Design footings, built-up beams, joists, columns in timber for a double cantilevered two story deck project. Use FOUR different methods in the design: a) Allowable Stress Design with safety factor, b) Limit States Design (metric), c) Working Stress Design using LDF and CFU + other factors, and d) Working Stress Design using C_m , C_d , C_f , C_t , C_{fu} + other factors. Short, long and intermediate columns, Compare FOUR methods of design. Check shear, moment, deflection and bearing. Check L/d and d/b ratios.
